THE PROMISE AFTER THE DEPLOY

Your health check is green.
Your customer was charged twice.

Aftercare closes the recovery loop between a healthy service and a correct customer outcome.

THE GAP

Rollback stops the next duplicate.
It does not repair the duplicates already in the ledger.

ONE PRECISE CONTRACT

One tenant + one idempotency key + one amount = one net debit.

01 **DETECT**

Reproduce the failed contract; measure HTTP health separately.

02 **CONTAIN**

Restore and independently test the known safe revision.

03 **RECONCILE**

Append synthetic reversals without rewriting the ledger.

04 **REPAIR + PROVE**

Test, package, replay, promote and preserve the decision.

AUTHORITY IS EXPLICIT

Browser: hands-off, fixed-fixture reference recovery; zero model calls.
GitLab Duo: independent investigation, source repair and regression MR; human outcome review.

Synthetic credits only. No processor calls, real refunds or customer production deployment.

WHAT THE IMPLEMENTATION PROVES

Evidence, not an animated success state.

24 / 1	**Checkout retries / purchase** Seeded reference scenario
23	**Extra captures reconciled** Append-only synthetic reversals
7 + 32	**Contracts + candidate canary requests** Other recovery and health requests counted separately
0	**Reference model calls** Deterministic reviewed repairs

Verified on 20 October: Duo session 9737653 finished and created MR 1; ten repair contracts passed. Four of five added regressions fail against the original source. Full main pipeline 2966841144 passed nine stages and 38 application/CLI tests at that snapshot. Cloud smoke checks passed auth, guest isolation, recovery and artifact digests.

Safety and integrity: an unsafe reference candidate is blocked before execution. A SHA-256 chain detects changes relative to a trusted head; it is not an external signature. The GitLab MR remains open for supervised review.

A FOCUSED FIRST BUYER

A small SaaS engineering or platform team using GitLab, where transaction incidents create work across on-call engineering and finance support.

Proposed pricing: US$99/environment/month, including 20 agent-assisted incidents. **Illustrative costs:** US$10 fixed + 20 x (US$0.50 model + US$0.02 execution + US$0.01 evidence) = US$20.60. About 79% remains before support, fees, tax and sales.

All amounts above are hypotheses, not measured spend or provider quotes. No paid plan, customers, revenue or validated demand is claimed. Real compensation adapters and organization governance remain future work.

POSITIONING AND SOURCES

Business-metric rollback and synthetic journeys already exist. The proposed wedge is already-created harm, bounded compensation and source-repair proof in GitLab.

LaunchDarkly: guarded releases | Harness: deployment verification | Checkly: synthetic monitoring

No environmental award claim: energy and SCI baseline are unmeasured. SCI methodology. Created and directed by Shivam Gupta with AI-assisted engineering.

Try the public Google Cloud application | Source and execution evidence on GitLab

Human narration, YouTube upload and final Devpost entry remain pending.
